

How Certes Protects Your Data

Like Preventing a Bank Heist

Imagine your sensitive data is like stacks of cash being transported in an armoured truck.

Without protection, cybercriminals – just like masked robbers – are waiting for the perfect moment to strike, steal, and take advantage of your valuable assets.

THE PROBLEM

Data Heists

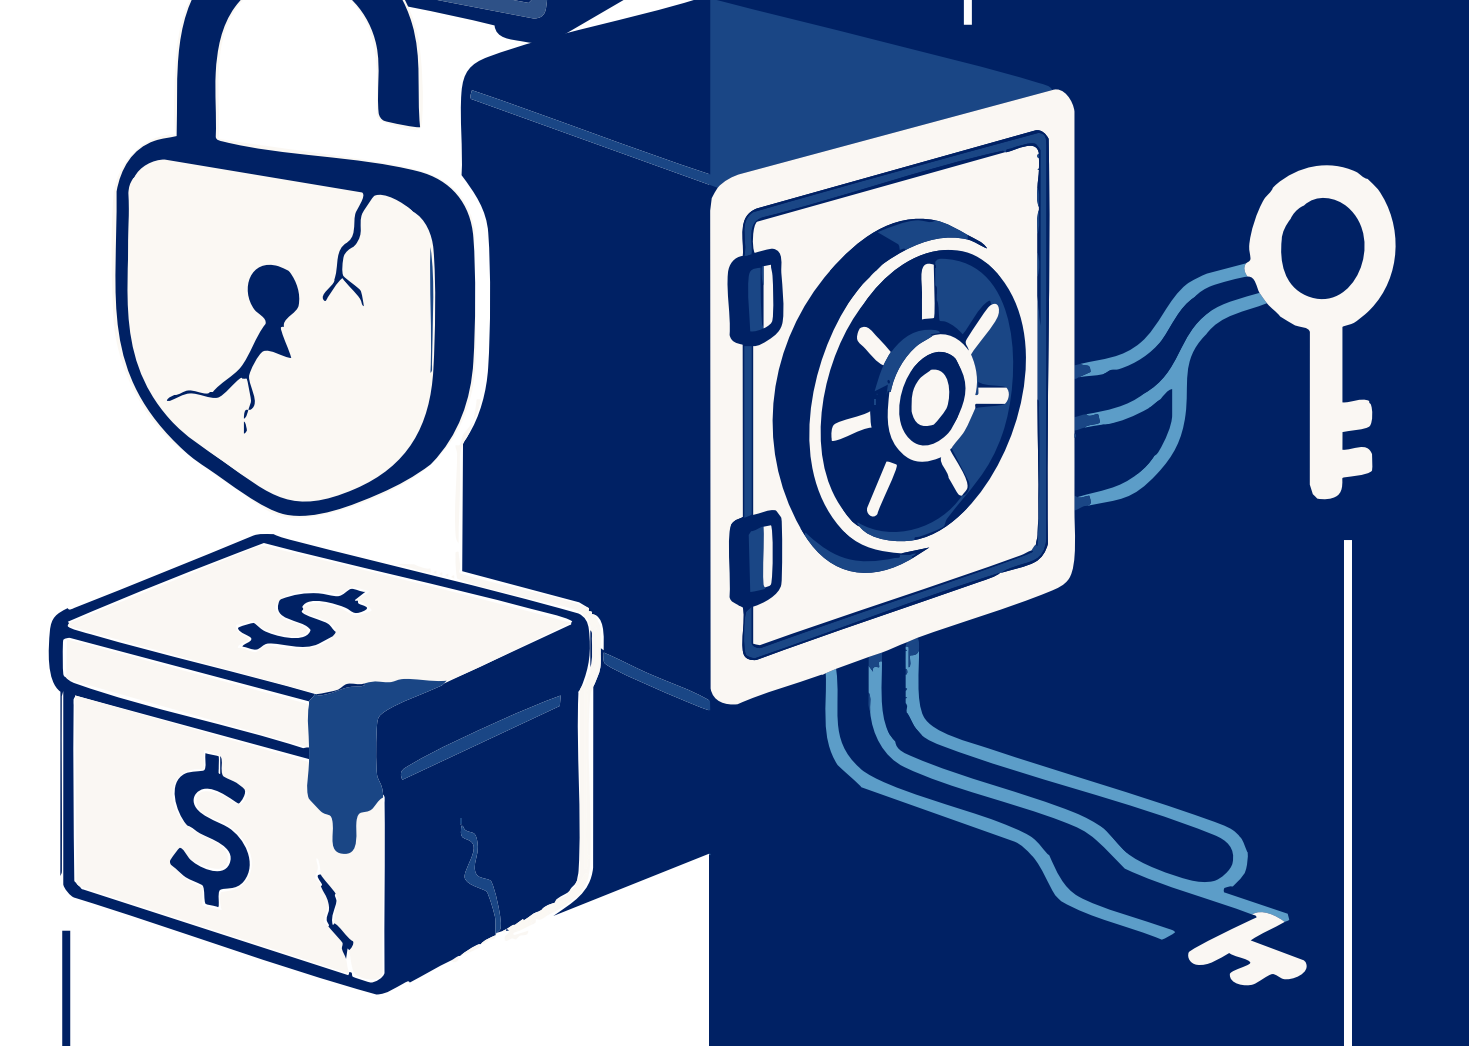

Just like in a bank robbery, attackers often target vulnerabilities while your data is in transit. If security is weak, criminals can intercept the cash (your data), causing chaos and financial loss.

THE CERTES SOLUTION

Quantum Safe Data Protection + Making Data Valueless to Thieves

Banks protect cash transport with security dye packs that make stolen money unusable. Certes takes a similar approach, not by damaging data, but by ensuring it remains protected, and rendered useless to unauthorized parties through quantum-safe patented protection via Certes Data Protection and Risk mitigation (DPRM) solution. Even if cybercriminals intercept your data, all they get is scrambled information that holds no value to them and is only accessible to the rightful owner.

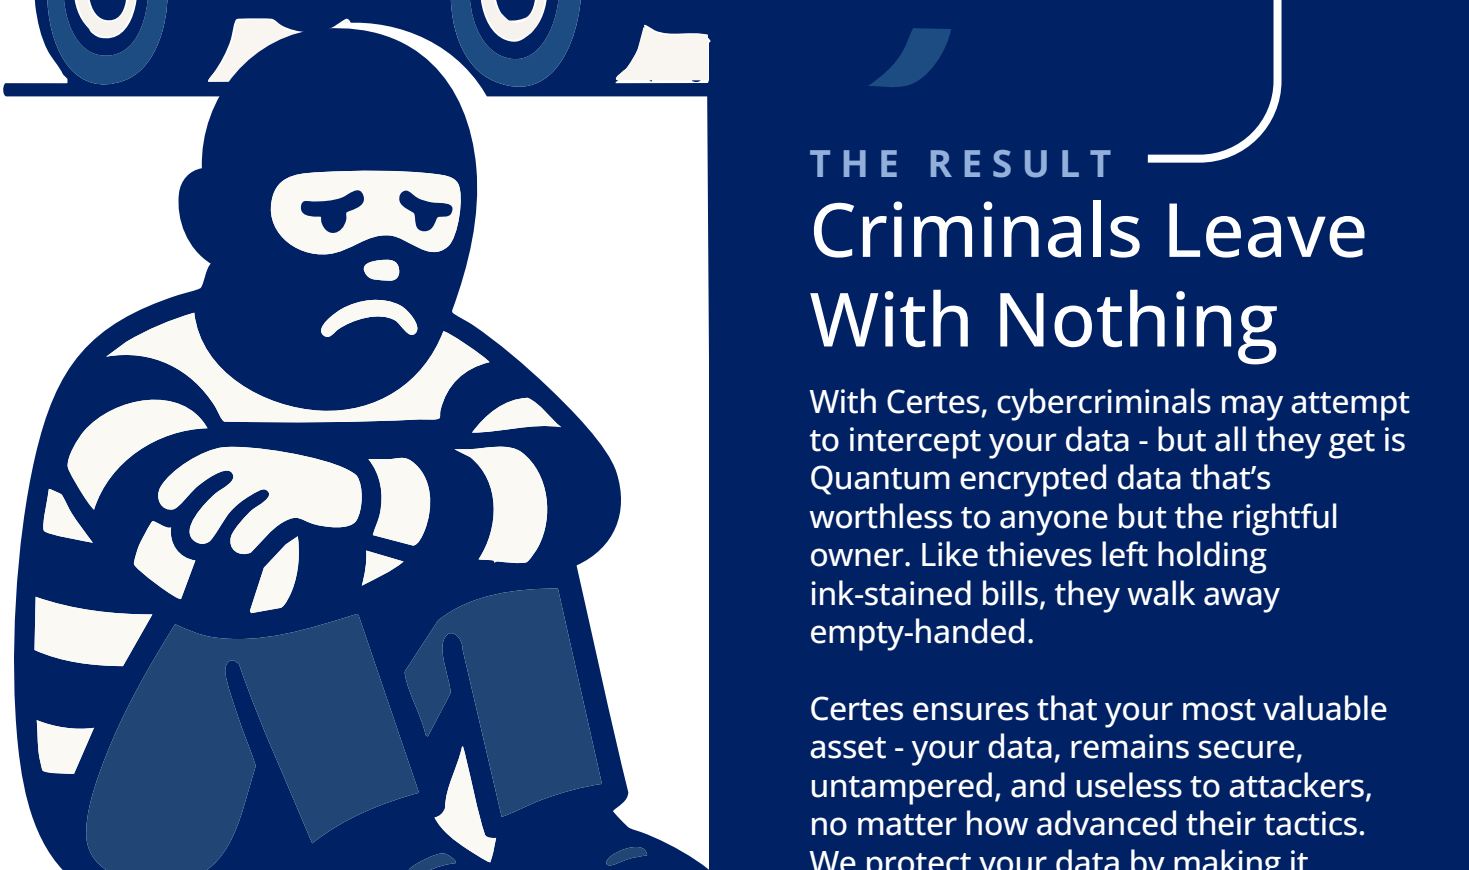

82% of data breaches involve a vulnerability in the network perimeter or a weak internal system

COMPLETE COVER

End-to-End Protection

Just as high-security banks ensure cash is protected from pickup to drop-off, Certes protects your data at every stage, ensuring it never travels in a vulnerable, readable state.

THE RESULT

Criminals Leave With Nothing

With Certes, cybercriminals may attempt to intercept your data - but all they get is Quantum encrypted data - that's worthless to anyone but the rightful owner. Like thieves left holding ink-stained bills, they walk away empty-handed.

Certes ensures that your most valuable asset - your data, remains secure, untampered, and useless to attackers, no matter how advanced their tactics. We protect your data by making it valueless to an attacker and the attack itself pointless.

\$10.5
trillion

By 2025, the cost of cybercrime is expected to exceed \$10.5 trillion annually, making it one of the biggest threats to the global economy

80%

of data breaches occur during the transfer or transmission of sensitive data.

Certes doesn't just protect your data.

It makes it useless to thieves.

Certes goes beyond traditional security methods, ensuring your data remains protected even against future quantum threats.

LAYERED PROTECTION

No Single Point of Failure

Traditional security methods rely on firewalls and access control, like weak padlocks on a cash box. Certes applies quantum safe algorithms, ensuring that even if attackers access the network, the Data remains locked away and protected.

82%

of data breaches involve a vulnerability in the network perimeter or a weak internal system
